FOREWORD

This assembly of references which has been completed by Dr. J.W. Donovan covers the recorded field of epidemiological research in New Zealand and its adjacent Pacific Island Territories since the earliest days of their histories. It brings to light a surprisingly wide range of disease aspects which, at some point of time, have occupied the attention of health workers.

This publication fulfils a great need and will make a valuable contribution to the study of disease. It is pleasing that the Department of Health has been able to assist Dr. Donovan in the compilation of this bibliography by making available to him all the sources of reference in our departmental archives. In addition, the Department has been able to bring this information to the attention of a wide circle of readers through its publication in this special report series. It is intended that this work be brought up-to-date and reissued at appropriate intervals.

Appreciation is extended to Mrs. R.H. Schusser of the National Health Statistics Centre who was responsible for the lay-out of this report and who so efficiently shouldered the editorial functions.

PREFACE

In 1966 I started a Ph.D. in Medical Statistics, studying trends in the health of the non-Maori population of New Zealand. Early in this course I felt the need for a bibliography of select topics which would be studied in detail. Extension to the present form, a bibliography of all published epidemiological studies relating to New Zealand and its Island Territories, has greatly increased the work's usefulness for both clinical and field epidemiologists, yet added little to the required searching of potential sources.

There are no references to dental epidemiology, but otherwise the term epidemiology is defined in its broadest sense - the study of the incidence of disease. Examples of the kind of work referred to are series of cases of any condition, vital statistical studies of incidence or prevalence, reports of epidemics and anthropometric surveys. References to technical articles dealing exclusively with drug therapy, or operative or laboratory techniques, are not given.

Inclusion of a reference does not imply merit. The bibliographer aims to list sources that may be useful; worth is best assessed by those familiar with the particular subject. Even some references containing recognizable errors are included, as a knowledge of what was believed at the time is essential to a study of the past. Some references of purely historical interest are given, such as the report by Thomas (1891) of, probably, a foetal-maternal blood group incompatibility.

Finally I wish to pay tribute to my supervisor, Professor H.O. Lancaster, who suggested the work, and on whose Bibliography of Vital Statistics in Australia and New Zealand it is based.

PRESENTATION

The bibliography is arranged in two parts.

The first is an alphabetical list of references. In this the Harvard system of citing is used, and titles of journals are abbreviated by the conventions of World List of Scientific Periodicals Published in the years 1900-1960, 4th ed., 1963-5. London: Butterworths. The entries are not annotated, but where discussion of a paper, such as one presented at a conference, is published, it is denoted by the letter d., with a page reference, immediately following the entry. Correspondence concerning an article, or editorial comment on it, is distinguished by the letter c., and appears on the next line with correspondent's name, year and a page reference.

To save space, a further device has been used for the many articles published more than once. These repetitions are denoted by the word rep., with date, journal and paging following. Where, with a repetition, no journal is mentioned, it appears in Proceedings of the University of Otago Medical School, with volume, and then article number in brackets.

Several authors have published under more than one set of initials, or initial names. Where this occurrence has been recognised the initials have been altered for consistency so that initials only are given for male authors and one Christian name is used for female authors. It is likely that many instances of this are undetected. Further, from the days when proof-reading was not at its present standard, several authors' names and titles have been found with recognizable mistakes. These have been corrected.

Many references are unsigned. Where these were editorial comment they have been classified under "Editorial" in the alphabetical index. The remainder are grouped chronologically after "Z" in the alphabetical index. Publications of the Department of Health issued annually or in a series are grouped following these entries.

The second part of the bibliography contains three indexes. The first of these is an index to the whole work, the second and third give references to articles concerning Maoris and Island Territories respectively.

The three indexes are similarly arranged. Each starts with a list of references to diseases arranged by the Eighth Revision of the International Classification of Diseases. (Manual of the International Statistical Classification of Diseases, Injuries and Causes of Death. Vol. I. Geneva: World Health Organisation). References are arranged by the list of three-digit categories, including the supplementary (Y) classification, of this work. Each index also contains an additional portion arranged by special topics not covered in the preceding part. In each category the references are arranged alphabetically by author; where there is no ambiguity, the author's initials are, for brevity, omitted. Authors who have written more than twice on a particular subject are distinguished by (passim), and dates of individual works are not given.
